Sequence 2, Application US/09692945

Patent No. 6797695

GENERAL INFORMATION:

APPLICANT: Chiron Corporation
APPLICANT: Kyoto University
APPLICANT: Kyoto University
APPLICANT: Kavanaugh, Michael W.

TITLE OF INVENTION: HUMAN FGF-20 GENE AND GENE EXPRESSION
TITLE OF INVENTION PRODUCTS
FILE REFERENCE: 60219-6/16770.001
CURRENT APPLICATION NUMBER: US/09/692,945
CURRENT FILING DATE: 2000-10-20
NUMBER OF SEQ ID NOS: 17
SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 2
LENGTH: 212
TYPE: PRT
ORGANISM: Rattus norvegicus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GENERAL INFORMATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        US-09-895-674A-1
                                                                                                                                                                                                                                                                                                      Sequence 45089, Application US/09270767
Patent No. 6703491
GENERAL INFORMATION:
APPLICANT: Homburger et al.
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REFERENCE: File Reference: 7326-094
CURRENT APPLICATION NUMBER: US/09/270,767
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 45089
LENGTH: 259
TYPE: PRT
                                                                                                                                                    Query Match

TITLE OF INVENTION: in Body Fluids, A Test Kit and Means for Carrying Out the
TITLE OF INVENTION: Method and Use of the Method to Diagnose the Presence of
TITLE OF INVENTION: Disorders Associated with the Metabolism of
NUMBER OF SEQUENCES: 21

## RESULT 1 ADC00799 ID ADCC 24-JAN-2001; 2001JP-00112010. 24-JAN-2002; 2002JP-00015959. JP2002355074-A. Escherichia coli; 0157:H7. 10-DEC-2002. enterohaemorragic; anti-bacterial. Enterohaemorragic E. coli 0157:H7-specific protein SEQ ID NO: 844 04-DEC-2003 ADC00799; ADC00799 standard; protein; (first entry) 558 ₿

The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the Sequence 558 Claim 3; SEQ ID NO 844; 2067pp; Japanese. Enterohemorragic Escherichia coli O157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.

WPI; 2003-451640/43.

  The present invention relates to novel EspFU polypeptides and their CC corresponding polymucleotides. The EspFU polypeptides are EspF-like CC corresponding polymucleotides. The EspFU polypeptides are EspF-like CC polypeptides encoded by genes of the cryptic prophage CP-933U of CC enterobemorrhagic Escherichia coli (EHEC) or renteropathogenic Escherichia coli (EPEC) that binds to a neuronal wiskott-aldrich syndrome protein (N-CC wASP) polypeptide or restores the actin pedestal formation activity of CC enteropathogenic E. coli (EPEC) strain KCl2. The invention further CC relates to a method of identifying a candidate compounds capable of CC binding to and/or modulating the activity of EspFU and compounds that CC inhibits protein protein interactions between EspFU and EspFU-interacting proteins such as N-wASP, transducer of Cdc42-dependent actin assembly-1 CC (Toca-1) and p21-activated kinase 1 (Pak1). EspFU polymucleotides are useful for treating EHEC infection. The present sequence is the CC useful for treating EHEC infection. The present sequence (Tir) protein. This sequence is critical for the formation of actin pedestals

   The present sequence represents Tir, a novel translocated intimin CC receptor (formerly termed Hg90) from an enterohaemorrhagic Escherichia CC coli (EHEC) strain. The sequence was deduced from an isolated tir CC polynuclectide (see AAX58859). Tir proteins are secreted by attaching and CC effacing pathogens such as EHEC and EPEC (see AAY06220) E. coli. The CC bacterial pathogens sinsert their own receptors into mammalian cell CC surfaces, to which the pathogen then adheres to trigger additional host cignaling events and actin nucleation. Diagnosis of disease caused by CC pathogenic E. coli can be performed by use of antibodies that bind to Tir of detect the protein or the use of nucleic acid probes for detection of mucleic acids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir CC peptides, a recombinant method for producing recombinant Tir, antibodies which bind to Tir, and a kit for the detection of Tir-producing E. coli care provided. A method of immunising a host with Tir to induce a CC protectins can be used in attenuated E. coli to induce a cell-mediated constraint for compounds which interfere with the binding of bacterial contents that the compounds which interfere with the binding of bacterial

   New isolated nucleic acid genes from Drosophila and
   infections cause a histopathological effect known as attachment and effacement on intestinal epithelial cells. The inhibitors can be used to produce food supplements or additives, especially where the food is a milk substitute. The method can be used to sort cells based on their ability to bind to a Tir independent cell binding domain of an intimin polypeptide. Polypeptides having Tir-independent intimin binding activity can be used to produce a vaccine against a bacterial disease. The present sequence represents a specifically claimed intimin C-terminal Tir binding domain amino acid sequence, for use in the method of the present

   AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY9940. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37310 represent PCR primers and hybridisation probes used in the isolation of the PRO
  Sequence 596

   The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucl acids may also be used in gene therapy

ö

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of and a control sample of normal cells, whereby a higher level of mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, treast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders the animal

   The present sequence is a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRC coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping

Eaton DL, Grimaldi i JC, Filvaroff C, Gurney ĮΈ, Gerritsen Watanabe CK, Goddard A, wood WI; Godowski

New isolated secreted and transmembrane PRO polypeptide useful for modulating biological activity of a cell, or for treating sports-related joint problems, osteoarthritis or rheumatoid arthritis.

Claim 20; Fig 100; 399pp; English.

CC antibodies which specifically bind to the proteins. The proteins are CC antibodies which specifically bind to the proteins. The proteins are CC useful for detecting a polypeptide designated as A, B, C or D in a sample CC suspected of containing an A, B, C or D polypeptide, by contacting the CC sample with a polypeptide designated as E, F, G, H or I (or vice versa) CC and determining the formation of a A/E, B/F, B/G, C/H or D/I polypeptide CC conjugate in the sample, where the formation of the conjugate is CC conjugate in the sample, where the formation of the conjugate is CC conjugate in the sample, where the formation of the conjugate is CC polypeptide, D is a PRO19760 polypeptide, C is a CC pRO1096 polypeptide, D is a PRO19760 polypeptide, C is a PRO1096 polypeptide and I is a PRO1890 polypeptide, E is a PRO5801 CC polypeptide, F is a PRO10199peptide, G is a PRO2010 polypeptide. The sample comprises CC a cell suspected of expressing the A, B, C or D polypeptide. The E, F, G, CC H or I polypeptide is labeled with a detectable label or is attached to a solid support. The proteins are useful for linking a bioactive molecule causes death of the cell. A, B, C or D or E, F, G, H, or I. The bioactive molecule is a toxin, a radiolabel or an antibody. CC The bioactive molecule is a toxin, a radiolabel or an antibody. CC or I, or antibodies against them are useful for modulating a biological activity of a cell expressing a polypeptide designated as A, B, C or D or E, F, G, H, or I. The cell is killed. The proteins are useful for cuseful in the treatment of a condition which is responsive to the proteins, as molecular weight markers for protein electrophoresis CC purposes, and as therapeutic agents for treating sports-related joint creating a polypeptide defects, osteoarthritis or rheumatoid arthritis or rheumatoid arthritis are useful as problems, articular cartilage delects, observations are useful as arthritis. Nucleic acids encoding the proteins are useful as hybridisation probes, in chromosome and gene mapping, in the generation of anti-sense RNA and DNA, for the preparation of the proteins, to generate transgenic or knockout animals which are useful in the development and screening of therapeutic useful reagents, for chromosome identification, and in gene therapy. The antibody is useful as a therapeutic agent, in a diagnostic assay and for affinity purification of the protein from recombinant cell culture natural sources. The present The invention relates to an isolated secreted and transmembrane PRO polypeptide having 80 % sequence identity to a sequence appearing as ABG95851-ABG95934 or their associated signal peptide, or a sequence of extracellular domain of the proteins with their associated signal peptide extracellular domain of the proteins with their associated signal peptide of lacking its associated signal peptide. Also included are the nucleic collaboration in the protein of the protein associated signal peptide. acids encoding the proteins, vectors, host cells, fusion proteins and peptide

   Score
  d. No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

```
The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
  Enterohemorragic E and a polypeptide

The present invention relates to a computational method (MI) for clidentifying adhesin and adhesin-like proteins, by computing the sequence. Sequences using five attribute modules of a neural network software, training an artificial neural network (ANN) for ceach of the computed five attributes, and identifying the adhesin and cadhesin-like proteins having probability of being an adhesin (Pad) as cequal or greater than 0.51. Also claimed is a set of 274 annotated genes encoding adhesin and adhesin-like proteins, having 274 fully defined 162-computed (SEQ ID NO: 185-658) sequences; a set of 105 hypothetical genes encoding adhesin and adhesin-like proteins, having 105 fully defined 306-15876 base pairs (SEQ ID NO: 659-763); a set of 279 annotated cadhesin and adhesin-like proteins, having 105 fully defined 33-3716 base pair (SEQ ID NO: 1279); a set of 105 hypothetical adhesin and adhesin-like proteins, having 279 fully defined 33-3716 base pair (SEQ ID NO: 1279); a set of 105 hypothetical adhesin and adhesin-like proteins, having 279 fully defined 53-3716 base pair (SEQ ID NO: 1279); a set of 105 hypothetical adhesin and adhesin-like proteins, having 105 fully connected multilayer feed forward ANN (I) based on (M1). (M1) is useful for identifying adhesin and adhesin-like proteins, of therapeutic potential, and identifying and short-listing conscient for further testing in development of new vaccine formulations to eliminate diseases caused by various pathogenic organisms. (M1) is useful for identifying putative adhesins that are important in drug discovery and preventing therapeutics for whooping cough, pneumonia, construit related organisms, and from bacteria belonging to a wide phylogenetic spectrum. (M1) is capable of predicting adhesive nature of unique proteins. The present sequence is a microbial pathogen adhesin

   CC The present invention relates to novel EspFU polypeptides and their CC corresponding polynucleotides. The EspFU polypeptides are EspF-like CC polypeptides encoded by genes of the cryptic prophage CP-933U of CC enterohemorrhagic Escherichia coli (EHEC) or enteropathogenic Escherichia coli (EPEC) that binds to a neuronal wiskott-aldrich syndrome protein (N-CC WASP) polypeptide or restores the actin pedestal formation activity of CC enteropathogenic E. coli (EPEC) strain KC12. The invention further CC relates to a method of identifying a candidate compounds capable of CC binding to and/or modulating the activity of EspFU and compounds that CC inhibits protein-protein interactions between EspFU and EspFU-interacting proteins such as N-WASP, transducer of Cdc42-dependent actin assembly-1 (Toca-1) and p21-activated kinase 1 (Pakl). EspFU polynucleotides are CC useful for treating EHEC infection. The present sequence is the CC useful for traating EHEC infection. The present sequence (Tir) protein. This sequence is critical for the formation of actin pedestals

  The present sequence represents Tir, a novel translocated intimin CC receptor (formerly termed H990) from an enterohaemorrhagic Escherichia CC coli (EHEC) strain. The sequence was deduced from an isolated tir CC polynucleotide (see AAX58859). Tir proteins are secreted by attaching and effacing pathogens such as EHEC and EPEC (see AAY06220) E. coli. The CC bacterial pathogens insert their own receptors into mammalian cell CC surfaces, to which the pathogen then adheres to trigger additional host CC pathogenic E. coli can be performed by use of antibodies that bind to Tir condicts acids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir peptides, a recombinant method for producing recombinant Tir, antibodies which bind to Tir, and a kit for the detection of Tir-producing E. coli care provided. A method of immunising a host with Tir to induce a proteins can be used in attenuated E. coli to induce a cell-mediated CC immune response to other polypeptides, e.g. antigens. A method for compounds which interfere with the binding of bacterial cc pathogens to their receptors is further provided

   The present sequence represents the N-terminal sequence of Tir (see also AAY06220), a novel translocated intimin receptor from an enteropathogenic Escherichia coli (EPEC) strain. The 78 Ma EPEC protein is secreted by the bacterial pathogen. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein, or the use of nucleic acid probes for detection of nucleic acids encoding Tir. A kit for the detection of Tir-producing E. coli is provided. Also provided are a method of immunising a host with Tir to induce a protective immune response, and a method for screening for compounds which interfere with the binding of bacterial pathogens to

   Vaccine; Gene-therapy; Staphylococcus aureus;
  09-FEB-2006
   effacing pathogens such as EPEC and EHEC (see AAY06221) E. coli. The bacterial pathogens insert their own receptors into mammalian cell surfaces, to which the pathogen then adheres to trigger additional host signaling events and actin nucleation. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein or the use of nucleic acid probes for detection of nucleic acids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir peptides, a recombinant method for producing recombinant Tir, antibodies which bind to Tir, and a kit for the detection of Tir-producing E. coli are provided. A method of immunising a host with Tir to induce a protective immune response is also provided. In addition, Tir fusion protective immune response is also provided. In addition, Tir fusion protecting can be used in attenuated E. coli to induce a cell-mediated immune response to other polypeptides, e.g. antigens. A method for screening for compounds which interfere with the binding of bacterial mattenuates is a provided.

   ORF0826 shares a high degree of homology with S. epidermis secreted antigen Ssa. This immunogen can induce protective immunity against S. aureus. The immunogen is administered at a dosage of 1 microg-1 mg, subcutaneously, intramuscularly or mucosally. It is used for inducing protective immune response in a patient e.g. human for treating prophylactically against Staphylococcus aureus infection. The polypeptide immunogen provides protective immunity against Staphylococcus aureus. This sequence shares 85% homology to ORF0826 but is excluded from the
  Polypeptide immunogen useful for inducing protective Staphylococcus aureus comprises amino acid sequence, derivative of Staphylococcus aureus polypeptide.

  This sequence represents a polypeptide related to the immunogen, ORF0826. ORF0826 shares a high degree of homology with S. epidermis secreted antigen Ssa. This immunogen can induce protective immunity against S. aureus. The immunogen is administered at a dosage of 1 microg-1 mg, subcutaneously, intramuscularly or mucosally. It is used for inducing protective immune response in a patient e.g. human for treating prophylactically against Staphylococcus aureus infection. The polypeptide immunogen provides protective immunity against Staphylococcus aureus. This sequence was included for comparison.
  Sequence 166 AA;

  The invention relates to a chitinase (I) comprising a chitin binding domain (D1) connected to a catalytically active domain (D2) comprising the 289 amino acid sequence of ABF20209, or ABF20209 in which one or more amino acids being deleted, substituted or added, through a direct or a connecting region. Also described: (I) a DNA (II) encoding (I); (2) a recombinant vector (III) containing (II); (3) a transformed host (IV) containing (III); and (4) producing (I). (I) is useful for hydrolyzing chitin. (I) exhibits high activity and stability, even at high temperature. The present sequence represents a Pyrococcus furiosus chitinase connection region amino acid sequence, which is given in the exemplification of the present invention.
   Novel chitinase comprising a chitin binding domain connected to a catalytically active domain, through a direct or connecting region, useful for hydrolyzing chitin.
